The decision folio

PLTR · META · CRWD · AVGO · GOOG / $1,000 hypothetical budget

▼ Fixed 5 November 2026 snapshot · inspect clocks

Fixed observation window: 5 Nov 2026. Macro API 15:53 UTC; equity quotes 15:54:50–51 UTC; completed history through 4 Nov. Company checks captured 16:16 UTC.

RESEARCH EDITION · 5 NOVEMBER 2026

Five stocks. One risk budget. No established edge.

A $1,000 research comparison with actual plugin Sharpe, conditional Kelly and convexity calculations, plus Page diagnostics. Computation is not approval; model inputs are not observed future outcomes.

RESEARCH CONCLUSION

The core plugin has now actually run. Equal dollars have higher historical Sharpe than inverse volatility on this sample; conditional Kelly and convexity outputs are shown with their inputs and formula bindings.

STRONGEST OBJECTION

The resampling model reuses a bullish two-year history. Binary payoff compression produces uncapped Kelly fractions that fail a full-path log-domain check; capped arithmetic still does not establish a prospective edge.

KEY UNCERTAINTY

Conditional positive Kelly references are calculated, not authorized or calibrated. Three tail fits reject, company valuation coverage is incomplete, quarterly cash-flow counterevidence remains, and gasoline quotes are non-coherent.

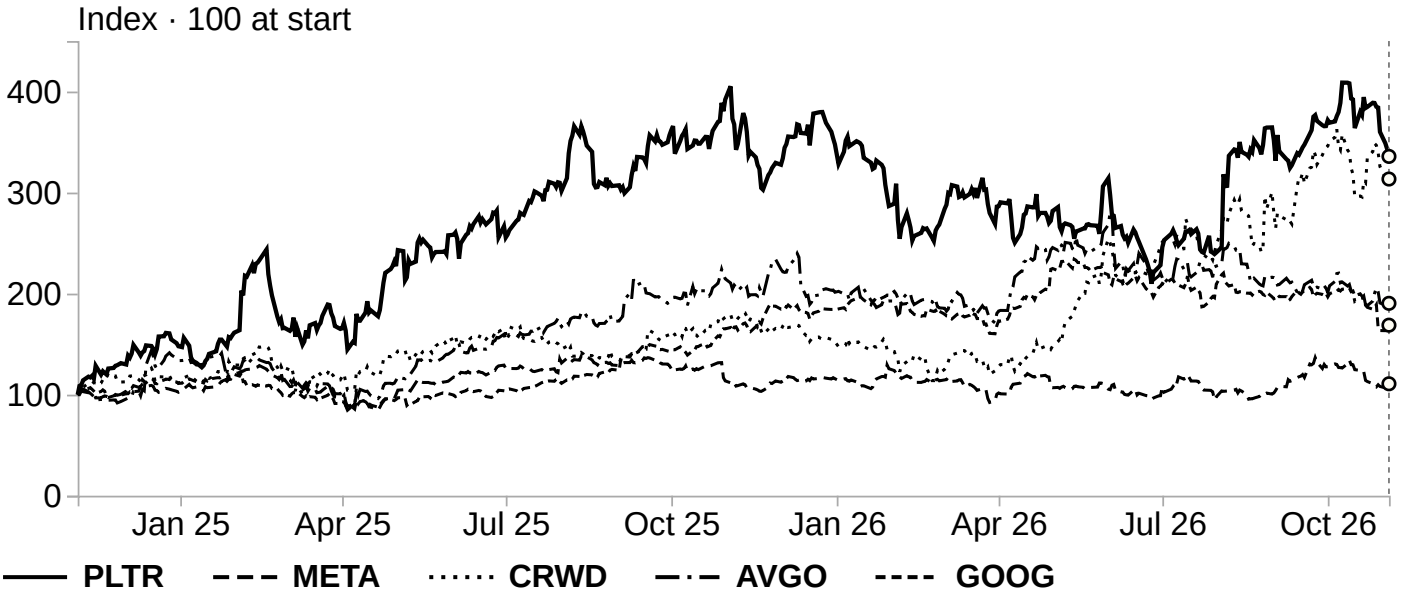

NEXT EVIDENCE CHECK

Run held-out or rolling tests with costs, inspect full filings and cash conversion, and establish explicit forward return/payoff assumptions before reconsidering exposure.

GOOG	277.68 USD 2026-11-05T15:54:51+00:00 [22] [23]	27.854%	278.54	1.003097

> MODELED sizing rule: capped inverse historical volatility, 30% per-name cap, twelve-month planning assumption. Dollar targets sum to $1,000; the equal-dollar benchmark is $200 per name. Fractions assumed and floored to six decimals. Not Kelly, risk parity, an expected-return optimizer or model-authorized sizing. Exact rounding cash is $0.001195270. No order is proposed or executed.

SIZING AND RISK CONSTRAINTS

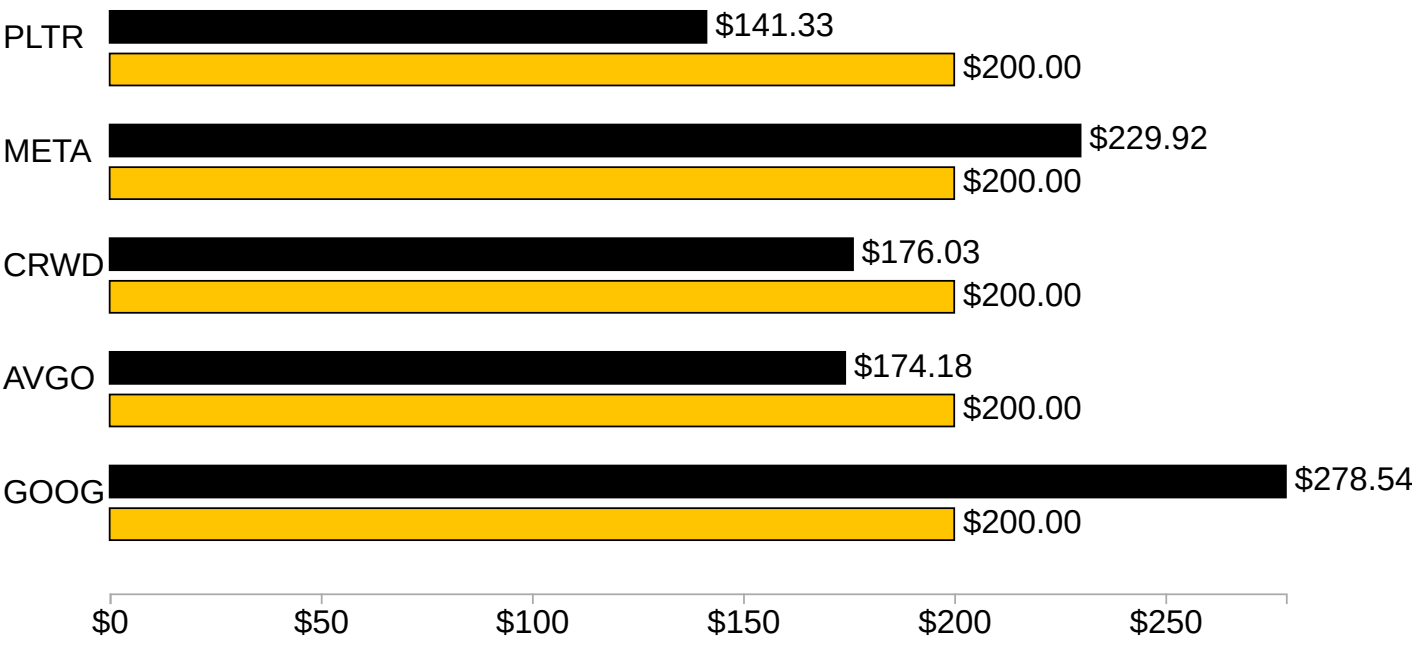

No positive model-authorized sizing. Positive conditional Kelly references are calculated, not authorized or validated forward edge. No authenticated approval or borrowing. The $1,000 budget, 12-month planning horizon, quarter-Kelly fraction, confidence multiplier, exposure caps and fractional shares are modeled illustration choices, not measured personal constraints or user-approved sizing. The original risk-only weights and conditional Kelly sleeve are distinct comparisons.

02 / CALCULATE · HYPOTHETICAL

Same budget, different weights

$1,000 budget in each illustration. No positive model-authorized sizing for any ticker.

Black, upper bar: risk-only · Yellow, lower bar: equal dollars ($200 each)

Risk-only inverse-volatility illustration; full-sample look-ahead. Not recommended or authorized sizing. Fees, taxes and rebalancing costs omitted.

02 ACTUAL CORE-PLUGIN CALCULATIONS · CONDITIONAL INPUTS

Run the engine. Then challenge its assumptions.

calculate under modeled inputs. All five stocks now have actual Sharpe, Kelly and convexity outputs from the installed plugin. These are calculated values—not section labels, calibrated forecasts or approval to trade.

MODELED · EDITORIAL READING

A number is not permission

Positive Kelly references are calculated under an in-sample model, not calibrated forward stock odds or approval to deploy capital.

Native calculations under model inputs; standalone caps are not combined portfolio weights

NATIVE FINANCE · NATIVE CONVEXITY SCORE

TICKER	HISTORICAL SHARPE ·0%	FULL BINARY-KELLY FRACTION	CAPPED STANDALONE REFERENCE	NATIVE CONVEXITY SCORE
PLTR	1.2610	3.5930×	30.00%	35.0612×
META	0.3270	1.7510×	21.89%	2.8910×
CRWD	1.3658	4.8388×	30.00%	50.9691×
AVGO	0.8781	3.8969×	30.00%	16.5396×
GOOG	0.9691	5.4541×	30.00%	20.8843×

The input model is not a validated edge. Kelly/convexity use 4,000 joint historical moving-block trials: 500 retained returns, 252-session horizon, 21-session blocks, fixed seed 20261105. Shared blocks preserve contemporaneous dependence. Stationarity, drift, block choice and a bullish sample drive these conditional outputs; valuation and forward calibration remain missing.

Full-path domain check: the installed plugin also tested expected log growth on all 4,000 retained paths. Every uncapped binary-Kelly fraction leaves nonpositive wealth on some retained tail path; the full-distribution log calculation is unavailable there. Capped references have valid log domains in those sampled paths. This does not certify unseen tails or turn the binary fraction into a joint/full-distribution optimum.

Kelly sequence: `full × 0.50 confidence multiplier × 0.25 Kelly fraction`, then a 30% standalone stock cap. These are analyst illustration choices, **not user-selected or approved constraints**. Full fractions above 1 are theoretical references, not permission to borrow. Native warning text calls the cap a “user cap”; that is engine wording, not proof the user chose it.

The p/g/l inputs are conditional resampling assumptions; not calibrated stock success odds

NATIVE FINANCE · QUARTER REFERENCE BEFORE CAP

TICKER	MODELED WIN FREQUENCY	MEAN POSITIVE PAYOFF	MEAN NEGATIVE PAYOFF	QUARTER REFERENCE BEFORE CAP
PLTR	85.58%	136.75%	-23.14%	44.91%
META	59.03%	44.25%	-22.05%	21.89%
CRWD	89.40%	109.46%	-18.11%	60.48%
AVGO	78.77%	84.64%	-18.99%	48.71%
GOOG	84.08%	58.06%	-14.68%	68.18%

Do not add the standalone references as portfolio weights. They imply $1,418.88 across five separate $1,000 tests, exceeding the one $1,000 budget. Neither independent Kelly fractions nor a cap automatically solve correlated joint allocation.

Use of the actual portfolio Kelly output — conditional comparison, not an order

NATIVE FINANCE · CONDITIONAL PORTFOLIO-KELLY SLEEVE

BUDGET COMPONENT	ORIGINAL FULL-SLEEVE RISK ILLUSTRATION	CONDITIONAL PORTFOLIO-KELLY SLEEVE
PLTR	$141.33	$137.32

BUDGET COMPONENT	ORIGINAL FULL-SLEEVE RISK ILLUSTRATION	CONDITIONAL PORTFOLIO-KELLY SLEEVE
META	$229.92	$223.40
CRWD	$176.03	$171.04
AVGO	$174.18	$169.24
GOOG	$278.54	$270.64
Cash	$0.00	$28.36
Total	$1,000.00	$1,000.00

The native inverse-volatility portfolio case gives a sleeve reference of97.16%. Its actual dollar output is floored to cents, then apportioned across the original relative weights; $28.36 remains cash. This is **not joint Kelly optimization**, not a validated recommendation and not authenticated approval. It does not relabel the original risk-only weights as Kelly weights.

The new arithmetic changes the comparison: equal dollars have higher historical Sharpe than inverse volatility on this same sample, despite higher volatility. Lower volatility alone did not establish better risk-adjusted return. Neither in-sample result establishes future superiority.

▼ EXECUTION PROOF · ACTUAL INSTALLED PLUGIN

Capital Decision Lab v0.2.0, frozen source 330cdfee69f799f268c13005873bb77d8e7223e4. Seven base streams exercised isolated Hermes model-facing tool dispatch and CLI; 35 supplied cases each invoked native Sharpe, Kelly and convexity. Parent rehashed 136 installed files and 8 actually imported sources. No current-desktop dispatch, user approval, records or trades are claimed.

03 BUSINESS MODEL · COUNTEREVIDENCE

Growth is not the same as cash conversion

measured — company-reported, limited scope. The primary checks below are separate context, not inputs to the price-history fits. Negative quarterly cash flow remains visible: a familiar platform is not automatically a current cash-flow refuge. These definitions and periods are not fully comparable; no audited valuation conclusion follows.

MODELED · EDITORIAL READING

The cash question

Growth alone does not settle cash conversion, capital intensity or valuation. Read the negative quarterly figures alongside the coverage gaps.

LIMITED PRIMARY COMPANY CHECKS

COMPANY	PERIOD / COVERAGE	REPORTED REVENUE	CASH-CONVERSION COUNTEREVIDENCE	SOURCE
PLTR	Q3 2026	$2.31bn; +96% YoY	$1.22bn adjusted FCF (non-GAAP)	[26]
META	Q3 2026	$64.60bn; +26% YoY	FCF -$2.12bn; capex $34.91bn including finance-lease principal	[24]
GOOG / Alphabet	Q3 2026	$127.6bn; +25% YoY	FCF -$9.1bn this quarter; $19.7bn trailing twelve months; capex $51.4bn	[25]
CRWD	Full release unavailable	Not promoted from search snippets	HTTP/browser 403; quote/history still usable	[18][19]
AVGO	Full release unavailable	Not promoted from search snippets	HTTP/browser 403; quote/history still usable	[20][21]

modeled — Porter / Helmer / business-model questions, not moat scores. For PLTR, test implementation economics and durable switching costs. For META and GOOG, test whether distribution advantages survive capital intensity and competitive change. For CRWD, inspect retention, customer economics and cash conversion; for AVGO, inspect customer concentration and investment-cycle exposure. Those are research questions—not findings established by this price dataset. No complete five-company filings review or reverse DCF has run.

---

04 MACRO · EXPLICIT HORIZONS

Markets price events, not your portfolio

measured quotes → forecasted events. Canonical raw API observations are from 15:53 UTC on November 5; browser captures have their own later timestamps and UI rounding. No normalization, calibrated probability claim or joint macro forecast was applied. Release delays can invoke contract-specific fallback rules; inspect the linked terms. BLS calendar retrieval was 403, so its release times below are contract-specified, not independently calendar-verified.

MODELED · EDITORIAL READING

Do not repair the market

Raw bucket prices are not a calibrated joint forecast. The gasoline book remains non-coherent; the largest quote is not a reliable direction probability.

03 / MEASURED · RAW MARKET QUOTES

A quote is not a calibrated probability

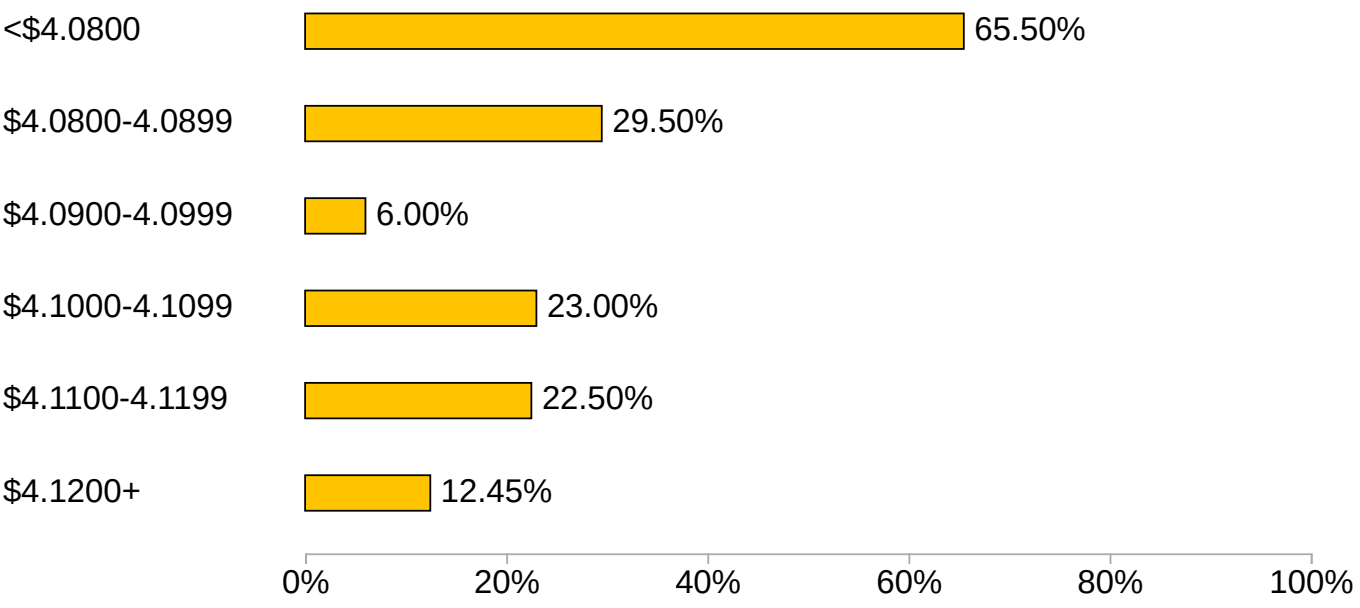

Six captured contract books, without normalization. Raw quote units: percent of contract payout, not stock win odds.

Inspect a captured market

Gas prices on November 6?

Captured 2026-11-05T22:53:19.603108+07:00 · Raw sum 158.95% · Maximum spread 51.00 pp. AAA US national regular gasoline on November 6, 2026, 10:00 ET subject to date-consistency and fallback rules.

> **Downward-looking raw top bucket is <$4.0800 for November 6. Direction probabilities are unavailable: raw prices sum to 158.95%, spreads reach 51 percentage points, and the $4.1000–4.1099 bucket straddles the $4.1003 baseline; exact unchanged is not separately traded.**

Separate horizons and wide spreads prevent treating these books as one coherent probability distribution. Source 11 Source 12

Fed direction: summed raw quoted buckets favor hike 67.25%, versus hold 30.50% and cut 1.20%. Total 98.95%, unnormalized. This is contract-price arithmetic, not a stock win probability or all-in executable odds.

[1][2]

▼ **INSPECT THE UNDERLYING TABLE AND SOURCE NOTES**

MARKET QUOTES, NOT OBSERVED ECONOMIC OUTCOMES

CONTRACT	LARGEST RAW BUCKET	RAW YES PRICE ×100	RAW BUCKET SUM	HORIZON / RELEASE	SOURCES
Fed Decision in December?	25 bps increase	66.50%	98.95%	December 8–9, 2026 decision	[1][2][28]
US GDP growth in Q4 2026?	2.0% to 2.5%	21.00%	87.30%	Q4 2026; contract-scheduled release January 28, 2027	[3][4]
October Unemployment Rate	4.2%	52.00%	100.90%	October 2026; contract-scheduled November 6, 08:30 ET	[5][6]
October Inflation US - Annual	3.7%	89.50%	102.80%	October 2026; contract-scheduled November 10, 08:30 ET	[7][8]
October Inflation US - Monthly	0.3%	41.50%	100.05%	October 2026; contract-scheduled November 10, 08:30 ET	[9][10]

CONTRACT	LARGEST RAW BUCKET	RAW YES PRICE ×100	RAW BUCKET SUM	HORIZON / RELEASE	SOURCES
Gas prices on November 6?	<$4.0800	65.50%	158.95%	November 6, 2026; 10:00 ET observation subject to fallback	[11][12]

Gas direction probabilities: unavailable. Raw prices total 158.95%; spreads reach 51 percentage points. The $4.1000–4.1099 bucket straddles the observed $4.1003 baseline, and exact unchanged is not separately traded. A largest quote of 65.5% for the <$4.0800 bucket is not a reliable 65.5% probability that gasoline falls.

[11][12]

measured: AAA November 5 regular $4.1003/US gallon versus $4.1239 the prior day. **calculate:** change $-0.0236/gallon; divide by 3.785411784 liters/gallon to obtain $1.0832/liter. This observed decline is not the next-day forecast.

[13][27]

forecasted / conditional portfolio interpretation: a hike-and-sticky-inflation outcome would warrant discount-rate stress, not an automatic buy/sell rule. GDP, jobs, CPI and next-day gasoline have different horizons; no causal stock sensitivities or joint event probabilities were estimated. No Bayesian prior was supplied and no source was promoted to user_verified, so no belief update was applied.

---

05 RISK · SURVIVABILITY

The downside does not disappear at smaller size

calculate — MODEL-F01 / MODEL-F02. All five use 501 completed adjusted-price bars and 500 daily returns, November 5, 2024 through November 4, 2026. The partial November 5 session is excluded from every fit. Intraday change is separately calculated from the selected quote versus the last completed raw close—not the provider's pre-range chartPreviousClose.

MODELED · EDITORIAL READING

History is a description

Volatility, drawdown and daily loss statistics describe this sample. They do not establish a forward return or a valuation discount.

HISTORICAL DESCRIPTIONS; NOT EXPECTED RETURNS OR LOSS LIMITS

TICKER	ADJUSTED WINDOW RETURN	ANN. REALIZED VOL	MAX DRAWDOWN	DAILY VAR95 LOSS	DAILY ES95 LOSS	QUOTE VS NOV4 CLOSE	SOURCE
PLTR	235.81%	64.68%	-48.22%	6.10%	8.32%	-10.38%	[14]
META	10.78%	39.76%	-34.15%	3.60%	5.53%	-6.03%	[16]
CRWD	213.41%	51.93%	-37.18%	4.68%	6.45%	-10.48%	[18]
AVGO	90.41%	52.48%	-41.15%	4.52%	6.83%	-9.26%	[20]
GOOG	68.78%	32.82%	-30.24%	2.90%	4.52%	-3.35%	[22]

Volatility uses sample standard deviation ×√252. VaR is the type-7 interpolated 95th percentile of daily losses; ES averages losses at or above it. Drawdown includes initial wealth. Provider-adjusted endpoint returns are a total-return proxy, not an independently audited reinvestment ledger. A future loss can exceed historical VaR/ES. Historical Sharpe has now actually run through the installed plugin below. It requires historical returns and a

declared cash benchmark, not forward stock win probabilities. The benchmarks are assumptions, not measured Treasury yields. Validated forward investment returns remain unestablished.

calculate — FIN-F01, actual native `risk.sharpe.v1`. Same 500 completed daily returns,252 periods/year. The engine uses population daily standard deviation; it is not the sample-sigma convention in the descriptive table above. Constant annual effective cash benchmarks 0/3/5% are **modeled assumptions**, converted to daily before calculation. Standard square-root annualization is not a serial-correlation correction.

Actual native annualized historical Sharpe — ratios, not percentages or forward forecasts

06 ACTUAL EXECUTION · FIT BEFORE INFERENCE

Two useful models—and a boundary they cannot cross

modeled — Page is upstream mathematics, not a ninth investor. The live-data harness directly reused the frozen power-law, Markov and claim-compiler kernels. It did not run a forward decision overlay, generate a user-approved decision record or test a provider-backed LLM conversation. Parent replay checked 55 hashed files and exact results; eight model tests passed, with independent arithmetic checks.

MODELED · EDITORIAL READING

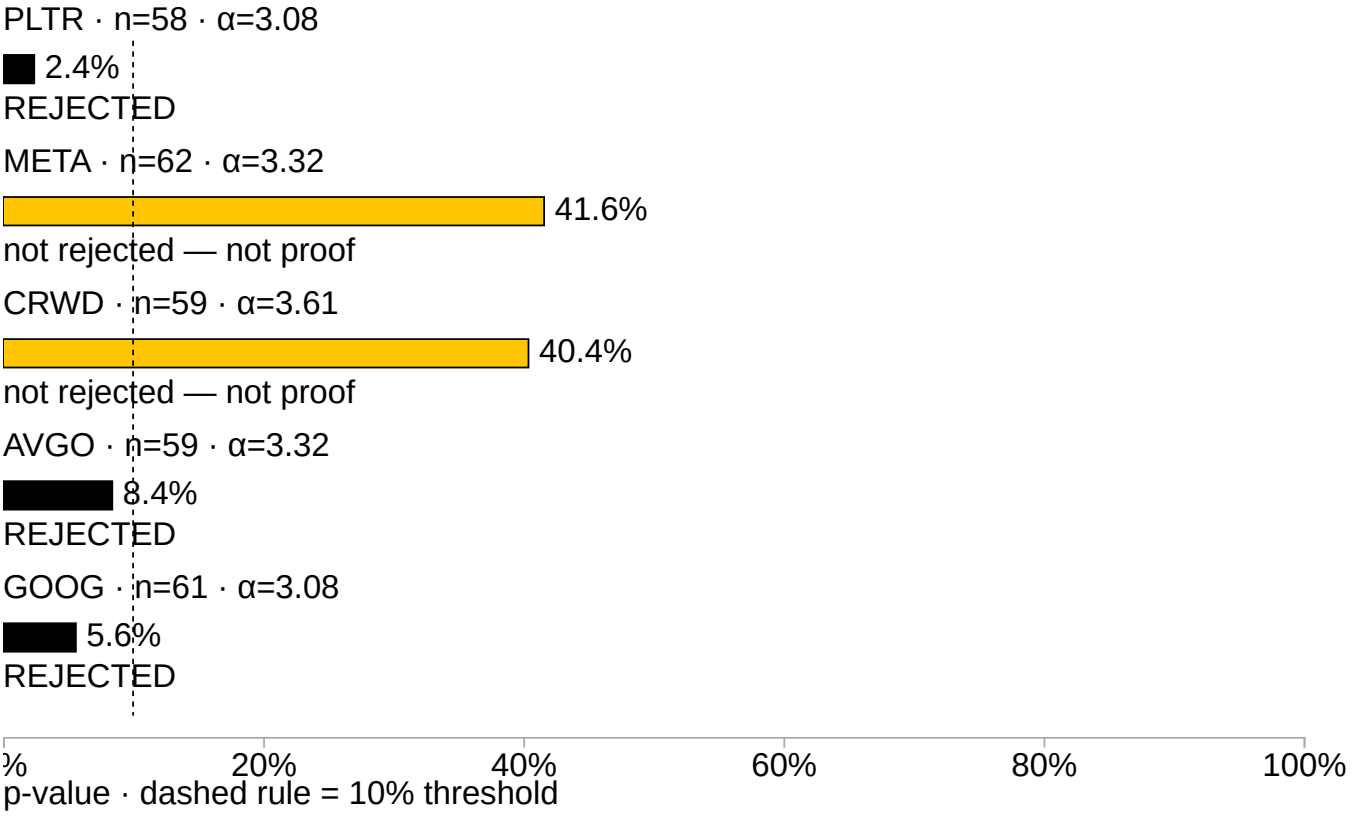

A failed fit is a finding

Three tail fits reject at the declared threshold. Non-rejection is not proof; neither model supplies positive sizing authorization.

04 / MODELED · FIT UNCERTAINTY

The tail model does not get a free pass

250-trial bootstrap diagnostic. Reject the proposed tail fit below the declared 10% p-value threshold. Tail sample sizes and fitted α shown for each ticker.

These small, 58–62-point tail samples limit confidence. Non-rejection is not proof and a p-value is not a probability that a stock will be profitable. Black bars: rejected fits; yellow: not rejected, not validated.

▼ INSPECT THE UNDERLYING TABLE AND SOURCE NOTES

APPLICABILITY BEFORE EXECUTION

FAMILY	STATUS	QUESTION / LIMIT
power_law	RUN	Daily history supports descriptive tail fitting; no current quote used as a tail dataset.
markov	RUN	Sequential adjusted returns available; thresholds and time homogeneity are modeled, not Fed/macro transitions or a forecast.
bass	UNAVAILABLE	No adoption time series, addressable-adopter carrying capacity or grounded p/q coefficients collected; price is not adoption.
bandit	NOT APPLICABLE	One-shot hypothetical allocation has no repeated arm selection, observed rewards or Bernoulli payoff parameters; do not invent stock win probabilities.

▼ INSPECT THE UNDERLYING TABLE AND SOURCE NOTES

MODEL-F03 — POWER-LAW FIT UNCERTAINTY IS MATERIAL

TICKER	TAIL OBSERVATIONS	XMIN LOSS	DENSITY A	BOOTSTRAP P	10% DIAGNOSTIC
PLTR	58	0.037191	3.076	0.024	**REJECTED**

TICKER	TAIL OBSERVATIONS	XMIN LOSS	DENSITY A	BOOTSTRAP P	10% DIAGNOSTIC
META	62	0.022968	3.318	0.416	NOT REJECTED, not proved
CRWD	59	0.032441	3.614	0.404	NOT REJECTED, not proved
AVGO	59	0.030344	3.319	0.084	**REJECTED**
GOOG	61	0.017981	3.075	0.056	**REJECTED**

Threshold xmin is the predeclared 75th percentile of positive daily losses, not selected for a favorable p-value. All point density exponents exceed 3, but finite point-estimate Pareto moments do not validate a rejected fit or prove safety. Only 58–62 observations enter each tail; 250 IID parametric bootstraps hold xmin fixed and omit threshold uncertainty and serial dependence. Unlevered daily simple losses are bounded, so infinite-moment language describes an ideal unbounded extrapolation.

▼ INSPECT THE UNDERLYING TABLE AND SOURCE NOTES

MODEL-F04 — STATIONARY FREQUENCIES, NOT TOMORROW'S ODDS

TICKER	DOWN STATE	NEUTRAL STATE	UP STATE	OBSERVED TRANSITIONS
PLTR	33.50%	25.62%	40.88%	499
META	28.86%	42.69%	28.45%	499
CRWD	32.48%	30.65%	36.87%	499
AVGO	31.47%	33.68%	34.86%	499
GOOG	25.25%	44.29%	30.46%	499

States: down<-1%, neutral including ±1%, up>+1%. The actual kernel checked ergodicity and stationary residuals. Fixed boundaries and time homogeneity are assumptions, not economic regimes. **MODEL-F08: no robust_positive and no positive model-authorized sizing for any ticker.** Tail shape and state frequency answer different questions and share histories; they cannot be averaged into stock upside or counted as independent confirmations.

---

07 CONDITIONAL STRESS · NO MANUFACTURED EV

Convexity calculated, uncertainty retained

calculate under modeled scenarios — actual native convexity engine. This replaces the earlier uniform-shock-only placeholder. The plugin calculates probability-weighted upside/downside, breakeven probability, expected P&L and scenario asymmetry. It is **not option gamma** and these are not issuer price targets.

MODELED · EDITORIAL READING

Do not confuse a mean with a limit

Native scenario max_loss is a compressed bad-state mean, not the worst resampled path or the maximum possible loss. Payoff asymmetry is not option gamma.

Native scenario asymmetry — probabilities/payoffs remain unapproved model assumptions

NATIVE FINANCE · CONVEXITY SCORE

TICKER	BULL / ABSOLUTE BEAR	BREAKEVEN PROBABILITY	CONDITIONAL MODEL MEAN RETURN	CONVEXITY SCORE
PLTR	7.4164×	11.88%	113.68%	35.0612×
META	2.6013×	27.77%	17.08%	2.8910×
CRWD	7.7543×	11.42%	95.94%	50.9691×

TICKER	BULL / ABSOLUTE BEAR	BREAKEVEN PROBABILITY	CONDITIONAL MODEL MEAN RETURN	CONVEXITY SCORE
AVGO	5.6482×	15.04%	62.64%	16.5396×
GOOG	5.1535×	16.25%	46.48%	20.8843×

Bear groups all negative trials; base/bull/moon split sorted positive trials by 50/40/10% count boundaries. State probabilities use actual counts and conditional means. This preserves the full sample mean, **not within-state dispersion or full-distribution log growth**. Binary Kelly likewise compresses positive/negative variability. Large scores can be an artifact of sample drift and compression, not a durable economic moat.

A conditional-mean bad state is not the worst trial or a maximum possible loss

08 WHAT WAS ACTUALLY SIMULATED

Two bootstraps. Two different questions.

modeled — actual simulation scope. The original diagnostic simulation was the Pareto goodness-of-fit bootstrap: 250 trials per ticker, 1,250 synthetic tail datasets in total. It was not a simulation of five-stock future prices. Canonical hash-derived seeds and local RNG state allow exact replay without mutating global randomness.

▼ INSPECT THE UNDERLYING TABLE AND SOURCE NOTES

DETERMINISTIC DIAGNOSTIC REPLAY

TICKER	CANONICAL SEED / NATIVE RECEIPT
PLTR	534941970906036512

09 ACCOUNT BOUNDARY

No leverage assumed. No account accessed.

modeled: borrowing is assumed $0 in this hypothetical test; leverage is not used. This is not a measurement of an actual account. Broker maintenance, liquidation thresholds, financing rates and personal balances are unavailable, so the margin engine was not run. No missing broker field was assigned a reassuring invented value.

10 MISSING INPUT · NO SYNTHETIC CHAIN

Options were not collected

No options chain, expiration, strike, premium, spread or liquidity snapshot was retrieved. Options valuation and strategy sizing are **unavailable**; no options position is assumed. Missing chain evidence does not imply free optionality.

11 PORTFOLIO INTERACTIONS · IMPLEMENTATION LIMITS

Weights can organize risk. They cannot manufacture an edge.

calculate — MODEL-F05. All observed pairwise correlations are positive; they range 0.283–0.485 on this sample. Five tickers do not establish five independent risk sources, and crisis dependence may rise. No causal business-factor exposure or hedge effectiveness was estimated.

MODELED · EDITORIAL READING

Five names are not five hedges

Historical correlation is sample-dependent. The sizing comparison reuses fitted history and does not establish prospective protection.

05 / CALCULATE · SAMPLE DEPENDENCE

Different businesses, shared movements

Pearson correlations of 500 aligned historical daily returns. Fixed scale: −1 to +1; zero means no linear sample correlation.

MODEL-F06 / MODEL-F07 — SAME-HISTORY, DAILY-REBALANCED COMPARISON

ILLUSTRATION	ANN. REALIZED VOL	MAX DRAWDOWN	DAILY VAR95	DAILY ES95	FRACTIONAL ROUNDING CASH	CASH IF EACH TARGET FLOORED TO WHOLE SHARES
Equal dollars	34.04%	-30.89%	3.52%	4.43%	$0.000698700	$846.120
Capped inverse vol	31.72%	-29.68%	3.31%	4.18%	$0.001195270	$722.320

modeled — not a true defensive barbell. The constrained universe has no Treasury/cash sleeve beyond rounding residuals. Inverse volatility is a risk-only rule, not risk parity or valuation. The 30% cap is a chosen limit and does not bind the current sample. Full-sample weights evaluated on the same history introduce **look-ahead / in-sample bias**; hypothetical

daily rebalancing omits turnover costs. Fractional support is assumed. One whole share of each would cost $1534.635, above the $1,000 budget; the displayed whole-share cash is a mechanical floor of each target, not an optimized whole-share alternative.

Equal dollars remain a transparent benchmark. The lower same-history volatility is not proof of future improvement and does not override the missing forward-sizing inputs or substitute for a valuation thesis.

DLC — MODELED / SIMULATED ANALYTICAL LENSES

Eight ways to examine the same decision

> Simulated analytical lens based on the repository playbook; not a quotation, current view, endorsement or advice from the named investor.

SIMULATED LENS 01 · 200 WORDS

Scott Galloway

GOOG's lower volatility sustains research preference; PLTR remains least preferred for this hypothetical $1,000, twelve-month exercise. The card's diversification test rejects five technology names as diversified wealth, while its glamour-tax test demands cash economics rather than excitement.

Native historical Sharpe is 0.969065 for GOOG and 1.260962 for PLTR, using population volatility and an assumed 0% cash benchmark. PLTR's advantage challenges the boring-is-better instinct; GOOG wins neither a return contest nor immunity from its negative $9.1bn quarterly free cash flow. META also consumed cash; CRWD and AVGO lack inspected fundamentals.

Equal-dollar Sharpe 1.429836 exceeds inverse-volatility 1.383601 despite higher volatility. Lower turbulence is not better efficiency. Conditional portfolio Kelly produces a $971.64 stock sleeve and $28.36 cash, retaining original relative weights, not optimizing them. These are analyst illustrations, not approvals.

The 4,000-trial in-sample joint bootstrap assumes 252 sessions, 21-session blocks, and historical persistence; its probabilities are not calibrated future odds. GOOG's 30% capped reference violates the card's 3–5% wealth discipline if mistaken for a whole fortune. Full Kelly permits no borrowing.

Unnormalized Fed quotes warrant rate sensitivity, not panic. PLTR's 96% revenue growth is substantial counterevidence. Sustained GOOG cash deterioration or independently verified PLTR valuation and cash durability would reverse this ranking.

Playbook: candidate/dlc-Galloway · Sources: [1] [2] [14] [16] [18] [20] [22] [24] [25] [26] [28]

MODEL-F02 MODEL-F05 MODEL-F06 MODEL-F08 MODEL-F09 FIN-F01 FIN-F02 FIN-F03 FIN-F04 FIN-F05 FIN-F06

SIMULATED LENS 02 · 200 WORDS

Brad Gerstner

META remains the preferred research candidate; CRWD is least preferred pending evidence, not condemned as obsolete software. AI-first recategorization asks who owns indispensable data and distribution; Time to Get Fit demands spending accountability. META's 26% revenue growth interests this lens, but negative $2.12bn quarterly free cash flow contradicts an operating-leverage story.

The native historical Sharpe is 0.326984 for META versus CRWD's 1.365799, using population volatility and an assumed 0% cash benchmark. Conditional convexity scores, 2.890955 versus 50.969149, challenge META preference. These measure compressed scenario asymmetry, not option gamma or proven power-law winners.

META's conditional capped Kelly reference is 21.8879%: quarter Kelly times a 0.50 confidence multiplier, under an analyst-assumed 30% cap. Neither these assumptions nor full Kelly above one authorize allocation or borrowing. Standalone references cannot be combined within $1,000.

The 4,000-trial in-sample joint bootstrap resamples history into 252-session paths using 21-session blocks; outcomes depend on stationarity, not calibrated future odds. PLTR's growth deserves ontology-moat diligence; AVGO's bottleneck case and GOOG's infrastructure position require valuation and cash scrutiny. Tail fits cannot establish venture-style upside.

Unnormalized Fed quotes frame financing stress, not stock probabilities. Persistent META cash deterioration or verified CRWD retention, cash durability, and attractive valuation would reverse this ranking.

Playbook: candidate/dlc-Gerstner · Sources: [1] [2] [14] [16] [18] [20] [22] [24] [25] [26] [28]

MODEL-F03 MODEL-F04 MODEL-F08 MODEL-F09 FIN-F01 FIN-F02 FIN-F03 FIN-F04 FIN-F06

SIMULATED LENS 03 · 200 WORDS

Chris Camillo

META remains the preferred observational research target; PLTR is least preferred for deployment. The question is not which chart looks strongest, but whether an overlooked behavioral shift can materially move revenue before institutional recognition. No conversational dataset, search series, channel checks, or conversion validation was collected; none clears that funnel.

The plugin's historical META Sharpe of 0.326984, using population volatility and assumed zero cash return, describes weak past compensation for risk, not absent cultural opportunity. Its conditional Kelly reference of 21.8879% and convexity score of 2.890955 cannot manufacture an informational advantage. Those outputs recycle history through 4,000 joint block resamples over 252-session horizons, not calibrated future probabilities; convexity measures four-state payoff asymmetry, not option gamma. Quarter Kelly and 0.50 confidence multiplier are analyst choices, not approved sizing.

The offsetting-catalyst screen matters: measured quarterly META free cash flow was negative $2.12 billion. CRWD and AVGO lack inspected fundamentals; GOOG has no verified observational edge. MODEL-F08 still authorizes no positive sizing, and MODEL-F09 lacks adoption inputs.

Forecasted Fed tightening is stress context, not an entry signal. Waiting risks missing a genuine breakout. Change stance when independently corroborated buying intent converts into material revenue before information parity; the hypothetical $1,000 can remain uncommitted.

Playbook: candidate/dlc-camillo · Sources: [1] [2] [14] [16] [18] [20] [22] [24] [26]

MODEL-F02 MODEL-F08 MODEL-F09 FIN-F01 FIN-F02 FIN-F03 FIN-F04 FIN-F06

SIMULATED LENS 04 · 200 WORDS

Laffont / Coatue

AVGO remains the preferred thematic research candidate; PLTR is least preferred for deployment. Infrastructure necessity is a starting hypothesis, not a valuation. Build the financial story from customer demand through margins and cash conversion, then reverse-engineer why infrastructure spending might disappoint. CRWD and AVGO lack inspected fundamentals; META and GOOG have negative quarterly free cash flow.

The plugin's AVGO historical Sharpe is 0.878141 with assumed zero cash return and population volatility. Its conditional 30% Kelly cap is a constraint, not conviction; the 16.539570 convexity score describes four-state payoff asymmetry, not option gamma. All conditional probabilities reuse history through 4,000 joint block resamples, not calibrated forecasts. Quarter Kelly, 0.50 multiplier, and caps are unapproved analyst choices; standalone caps cannot form the hypothetical $1,000 budget.

Survival-first construction must acknowledge equal-dollar Sharpe of 1.429836 beats inverse-volatility 1.383601 despite higher volatility. Lower volatility alone does not establish superior opportunity cost. Shared histories provide no independent confirmation; MODEL-F03 rejects three tail fits and MODEL-F08 authorizes no positive sizing.

Forecasted tightening warrants discount-rate stress, not stock odds. The strongest objection is capitalizing unsustainable infrastructure demand. Change preference when inspected releases and joined customer-demand evidence show deteriorating infrastructure economics or superior application cash conversion; cash remains permissible.

Michael Mauboussin

GOOG remains preferred for research and PLTR least preferred for this hypothetical $1,000, not a purchase ranking. The outside view lacks a matched reference class; reverse DCF and price-implied expectations remain unestablished.

FIN-F05 changes the portfolio argument: equal-dollar historical Sharpe 1.429836 beats inverse-volatility 1.383601 despite higher volatility. Population sigma and assumed 0% cash define these calculate results, not prospective superiority. Full-sample fitted weights also retain look-ahead and omit costs.

GOOG's conditional full Kelly 5.454130 is a fraction, not borrowing permission. Quarter Kelly, a 0.50 multiplier and 30% cap are analyst choices, not approval. The modeled 4,000 joint historical block-bootstrap trials use 252 sessions, 21-session blocks and seed20261105; shared data and stationarity assumptions supply no calibrated edge. MODEL-F08 therefore survives.

Cash-flow-pattern diversification remains unproved: measured GOOG trailing FCF is positive, but quarterly FCF is negative; META also burns quarterly cash, PLTR reports adjusted FCF, and CRWD/AVGO coverage is missing. GOOG's reinvestment could permanently erode distributable cash, the strongest objection.

MODEL-F03 rejects three tail fits; Markov frequencies cannot rescue forecasts. Macro forecasted rates motivate sensitivity, not stock odds; gasoline quotes remain incoherent. Change preference if GOOG's quarterly drain persists while trailing cash generation declines; require reconciled PLTR cash flows and expectations testing.

Warren Buffett / Charlie Munger — combined card

GOOG remains preferred for research; CRWD remains least preferred because missing fundamentals block ownership appraisal, not because its franchise is inferior. Preserve hypothetical cash until competence and margin of safety are established.

CRWD's historical Sharpe 1.365799 is calculate output using population sigma and assumed 0% cash, not owner earnings. Its conditional convexity 50.969149 measures four-state payoff asymmetry, not gamma. Compressed bear loss is neither the worst trial nor maximum possible loss. These modeled outputs reuse 4,000 joint historical block-bootstrap trials over 252 sessions, with 21-session blocks and seed20261105, not calibrated odds or independent confirmation.

Equal-dollar Sharpe 1.429836 exceeds inverse-volatility 1.383601 despite higher volatility; lower variability alone fails the opportunity-cost test. Neither history establishes permanent-loss protection. MODEL-F08's refusal of positive sizing survives three rejected tail fits and shared-data dependence.

GOOG's measured $19.7 billion trailing FCF is countered by negative $9.1 billion quarterly FCF and $51.4 billion capex: reinvestment may become a permanent toll. META's quarterly drain, PLTR's adjusted FCF and unavailable AVGO fundamentals prevent easy comparisons.

Macro forecasted rates affect opportunity cost; uncalibrated contracts cannot appraise franchises. Change from waiting only after filings reconcile maintenance investment, distributable cash and moat durability, and conservative valuation establishes a discount. No purchase is authorized.

MODEL-F02 MODEL-F03 MODEL-F05 MODEL-F06 MODEL-F08 FIN-F01 FIN-F02 FIN-F03 FIN-F04 FIN-F05 FIN-F06

SIMULATED LENS 07 · 200 WORDS

Martin Shkreli

Prefer GOOG for fundamental diligence; PLTR is least preferred pending valuation, not a short. Reconstruct enterprise value, subtract dilution from owner cash, then reverse DCF market expectations before calling either cheap.

Measured GOOG trailing free cash flow is $19.7bn despite negative $9.1bn quarterly flow; META's negative $2.12bn challenges cash generation. PLTR's $1.22bn adjusted flow is non-GAAP. CRWD/AVGO primary fundamentals remain unavailable; no complete valuation establishes mispricing.

FIN-F01's historical GOOG Sharpe 0.969065 measures reward per population volatility at assumed 0% cash, not business value. FIN-F04's conditional convexity 20.884306 can reflect bullish resampling and four-state compression, not option gamma; native max_loss is neither worst trial nor security maximum.

FIN-F02 reuses 500 returns in 4,000 joint moving-block trials, 252-session horizon, 21-session blocks, seed20261105: modeled payoffs, not calibrated forward odds or independent confirmation. Conditional Kelly exists; MODEL-F08 still denies validated sizing authority. MODEL-F03 rejects PLTR, AVGO and GOOG fits; shared history cannot manufacture consensus.

Macro quotes describe forecasted events, not company payoffs. Strongest countercase: GOOG capex destroys owner cash, while PLTR's operating scale justifies expectations. Change preference after inspected filings reconcile capex and dilution and conservative reverse DCF favors PLTR. FIN-F05's higher equal-dollar Sharpe defeats automatic preference for inverse-volatility weights; neither comparison validates deployment.

Ed Thorp

Prefer CRWD for risk-screening research; META is least preferred after Sharpe comparison, not a deployment recommendation. FIN-F01's CRWD Sharpe 1.365799 exceeds META's 0.326984 at assumed 0% cash using population sigma; 3%/5% sensitivities are modeled benchmarks, not measurements.

Equal-dollar Sharpe 1.429836 exceeds inverse-volatility 1.383601 despite higher volatility. In-sample comparisons do not establish hedged excess returns. FIN-F03's CRWD full Kelly 4.838779 is conditional arithmetic, not calibrated edge or leverage permission. Quarter Kelly times 0.50 confidence multiplier and 30% stock cap are analyst assumptions, not approval; standalone caps exceed one budget. The $971.64 stock/$28.36 cash sleeve retains inverse-volatility weights, not joint Kelly optimization.

FIN-F02 uses 4,000 joint moving-block trials from 500 returns, 252-session horizon, 21-session blocks, seed20261105. Compressed win/loss averages and shared history supply neither validated forward odds nor independent confirmation. MODEL-F08's authorization remains false, not its calculation unavailable.

CRWD's conditional convexity 50.969149 may reflect bullish sampling and four-state compression, not hedge protection. MODEL-F03 rejects PLTR, AVGO and GOOG fits; CRWD nonrejection proves nothing. Missing CRWD/AVGO primary fundamentals and valuations weaken selection; META/GOOG negative quarterly cash flows challenge historical screens. Macro quotes cannot calibrate stock odds. Strongest countercase: CRWD's edge disappears after costs. Change stance after preregistered walk-forward hedged testing establishes excess returns.

12 PROVENANCE · MEASURED WORK

Count evidence—not confidence

measured / calculate — artifact metrology. Five exact ticker captures; 501 completed bars each; 26 verified stock raw-response hashes; six valid actual Polymarket screenshots totaling 1,250,422 bytes; one invalid blank-tab capture retained but excluded. The ledger registers 28 URLs, not 28 independent sources. Macro page/API and company-publisher relationships are disclosed.

No measured per-response token usage, cache receipts or provider-dollar costs were supplied; cost and token savings are **unavailable**, not zero. Screenshot bytes are not token counts. Layout follows the supplied Satori report/web guidance alongside Monocle-inspired editorial tokens; Plantin is not presumed installed. File fidelity, model replay and a visual/layout review are separate acceptance checks.

13 CONCLUSION · UNCERTAINTY · CHANGE TRIGGERS

Structure the question before committing capital

Core math actually executed. Historical Sharpe, conditional Kelly and scenario convexity now come from real plugin outputs, with cases and formula hashes. The previous report omitted that central requirement. The new calculations inform the benchmark and sleeve comparisons; they do not validate the historical input model or authorize an investment.

MODELED · EDITORIAL READING

Before capital moves

Held-out evidence, cash-flow reconciliation, explicit forward assumptions and implementation constraints come before any real action.

Decision status: RESEARCH ONLY. The report offers a reproducible $1,000 risk-budget illustration, not a buy instruction or financial approval. Page contributes descriptive tail/state diagnostics and limits; eight simulated investor frameworks interpret the same findings rather than voting an edge into existence. Three rejected tail fits, shared data, incomplete fundamentals and non-coherent gasoline quotes remain active counterevidence.

VALIDATION TRIGGERS—NOT AUTOMATED TRADING RULES

WHAT WOULD CHANGE THE VIEW	OBSERVABLE NEXT EVIDENCE
Held-out or rolling validation	Net-of-cost risk/turnover behavior outside the fitting sample; no result presumed
Valuation and capital intensity	Complete company filings, cash-conversion reconciliation and explicit forward assumptions; especially negative META/GOOG quarterly FCF
Tail/regime stability	Alternative distributions, threshold sensitivity and more observations; do not equate non-rejection with safety
Macro release/contract resolution	Observed official results and contract terms, not just snapshots; keep horizons separate
Implementation and authorization	Confirm fractions, costs, constraints and any separate approval before a real action

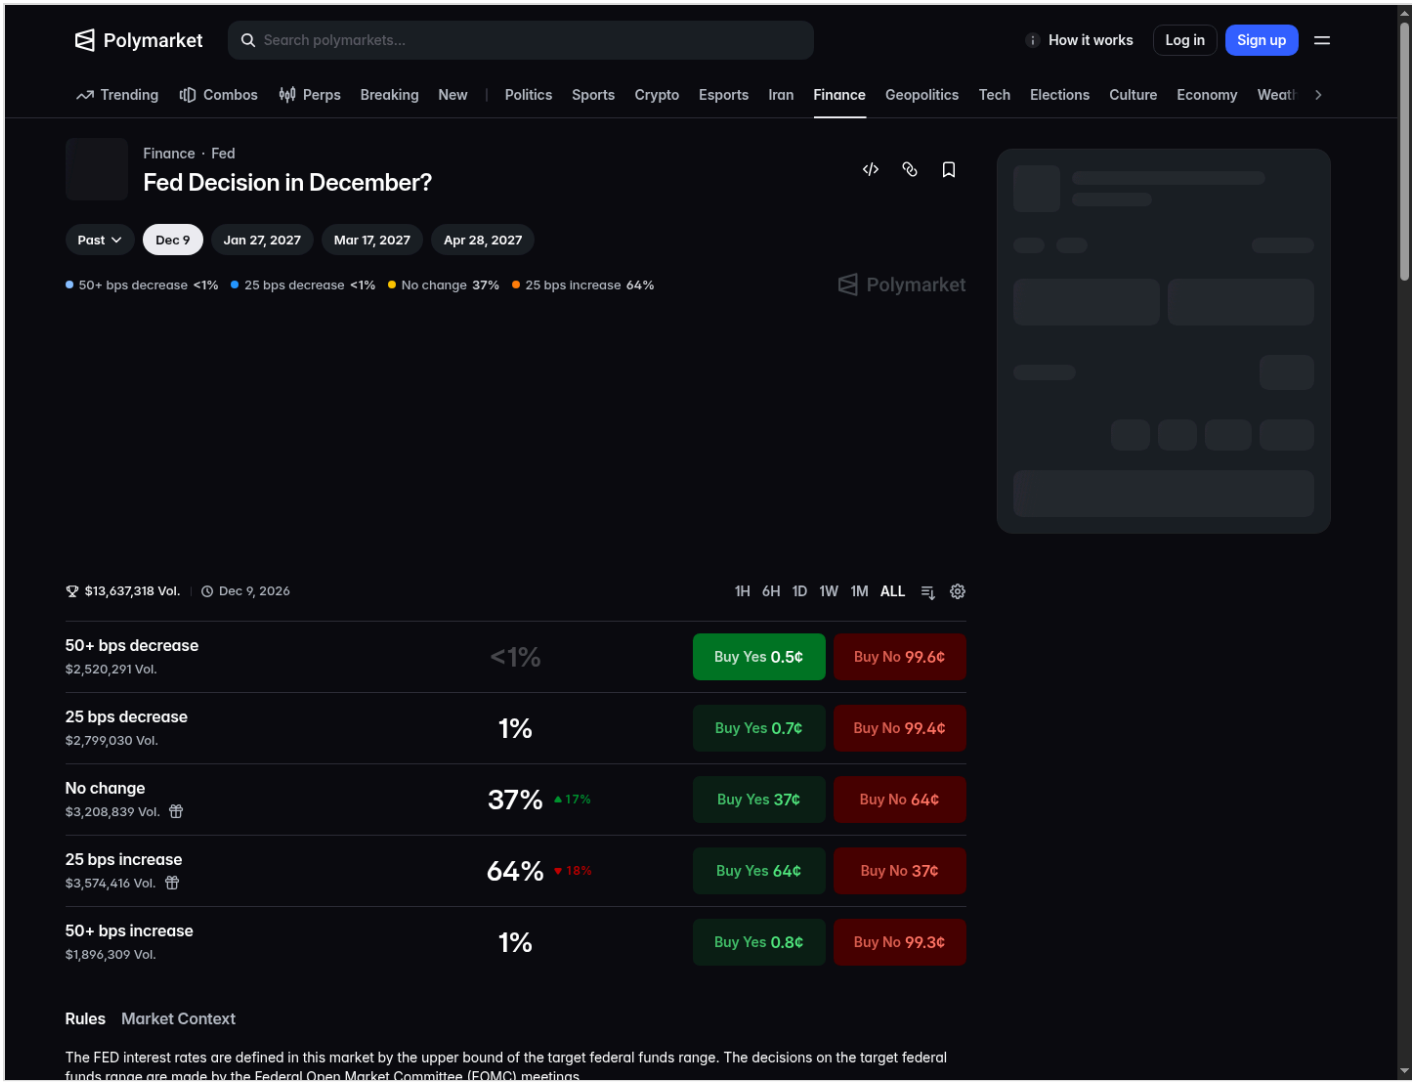

Financial facts are source observations; calculations derive from those inputs; model assumptions and simulated commentary remain conditional; future scenarios remain forecasted. Nothing in this document records a transaction or promotes unconfirmed evidence to human approval.

EVIDENCE FOLIOS · ACTUAL BROWSER CAPTURES

Evidence at a glance

measured

Fixed public snapshots

Five quote/history captures and six actual market screenshots; source observations are not human approval.

calculate

$1,000 target total

Actual native Sharpe/Kelly/convexity, shares, rounding cash, historical risk and conversions retain input/formula/case bindings.

modeled

Explicit conditional inputs

Page tail/state diagnostics and a shared-data bootstrap input model inform real core-engine calculations; neither creates independent forecast validation.

forecasted

Different event horizons

Macro contracts and conditional stress scenarios describe future outcomes, not observed results.

Read the labels

Observed, derived, assumed and future-facing values are not interchangeable. Unavailable is an evidence state, not a zero.

measured

Observed source data or captured market quotes, with source and as-of time; not automatically user-verified or true about a future event

calculate

Reproducible arithmetic derived from cited inputs: shares, weights, budget totals, conversions and other calculations

modeled

Assumptions, fitted/model-derived diagnostics and conditional analytical interpretations, with methods and limitations

forecasted

Future-facing scenarios and market-implied event outlooks, with explicit horizon and resolution conditions

Limits of the record

- Fixed, timestamped snapshots—not a live quote feed or executable prices. Provider contractual delay is unknown; independent publisher crosschecks were not simultaneous.
- The $1,000 budget, twelve-month planning horizon, fractional shares, no borrowing and weight cap are assumptions, not measured personal account constraints.
- Historical weights and risk comparisons are in-sample/look-ahead with daily rebalancing and omit fees, spreads, taxes and turnover costs.
- Native Sharpe, Kelly and convexity have now been calculated. Kelly/convexity use conditional in-sample model inputs, not calibrated forward stock odds, authenticated approval or a validated edge. DCF fair values and independent forward payoff estimates remain unavailable.
- Limited primary company checks cover PLTR/META/GOOG only; CRWD/AVGO full releases remained 403. This is not a full filings or valuation review.
- All mathematical families share the same adjusted price histories. Persona diversity does not supply independent evidence.
- Macro events have different horizons. Raw Polymarket contract prices are not normalized joint probabilities or observed economic outcomes.
- No brokerage access, trades, money movement, private financial records or authenticated human approval.

Portable local artifact. Georgia is an honest local serif fallback; no remote fonts, tracking, account access or live feed.
